1. Coursework 2 Final Submission Form

Field	Answer
Student name	Xiangtian Ren
Student ID	2617324
Game title	HIJIN-BATTLE
Unity version	2022.3.62f3c1
Build platform	Windows PC
GitHub repository link	https://github.com/Xiangtian-Gmae-program/Game_project
Final commit hash	ac858cabec7d79b215447f73bb7228b0f905b62d
Playable build link, if not uploaded directly	
How to run the game	Open the Windows build folder and run the generated executable, keeping the EXE, _Data folder, UnityPlayer.dll, and other generated files together. To run in Unity, open the project in Unity 2022.3.62f3c1 and start from TitleScene or MainMenuScene.
Controls	WASD move; Mouse camera/direction; LMB attack/charge; RMB jump; E defend; Space roll; Esc pause.
Main game objective	Defeat the enemy encounter in the moonlit duel scene while managing HP, guard value, spacing, and enemy behaviour.
Win / lose / completion condition	Win by defeating the encounter enemy/boss. Lose when player HP reaches zero. Completion is shown through result flow and progression/records.
Main systems/scripts I created	Player combat improvements, enemy AI tuning, main-game HUD, practice statistics, progression/records, settings, BGM/SFX controllers, font controller, scene/menu flow, story transitions.
External assets/templates/tutorials/AI used	Imported character/environment assets, custom font, music, sound effects, story/settings images, and AI assistance for planning, debugging, implementation guidance, and documentation.
Known issues	Animation variety remains limited by available clips; some imported models may not perfectly match the animation controller; additional SFX and more levels would improve the full game; final commit/build link must be confirmed.
